Java Dictionary
Project Requirements

Technical Requirements - MVP (Minimum Viable Product)

Any items marked incomplete in this section will result in the project receiving a failing grade. Your app must fulfill the below requirements.

	Complete?
Users can add new words and definitions to the dictionary.	
Users can update the definition of a word in the dictionary.	
Users can delete a word and its definitions from the dictionary.	
Users can conduct a search to find a word in the dictionary and display its definition.	
Users can see a history of past user actions taken in the app.	
Users can gracefully close the application.	
When a word is added to the dictionary, the app saves the new word and definition to a data file.	
When an existing word or definition is updated, the app saves the updated data back to the data file, replacing the old data.	
When an existing word is deleted, the app removes the word and its definition data from the data file.	
When launched, the app loads the data file containing the word information into memory.	
Unit tests should exist for each piece of functionality present in the app.	
The GitHub repo contains a runnable JAR file that allows users to download and use the project.	

Additional Requirements - MVP

More than three items marked incomplete in this section will result in the project receiving a failing grade. If three or fewer items are marked incomplete, the project is considered passing. Your app must fulfill the below requirements.

	Complete?
Users can conduct a search to find all the words in the dictionary that start with a given string.	
Users can conduct a search to find all the words in the dictionary that end with a given string.	
Users can conduct a search to find all the words in the dictionary containing a given string.	
Users can conduct a search to find all the words in the dictionary where the definition contains a given string.	
Users can add additional definitions (secondary, tertiary, etc.) to a word in the dictionary.	
Users can see an alphabetically sorted list of all the words in the dictionary.	
Users can see a history of past user actions taken in the app.	

Code Convention and UI/UX Requirements

More than two items marked incomplete in this section will result in the project receiving a failing grade. If two or fewer items are marked incomplete, the project is considered passing. Your app must fulfill the below requirements.

	Complete?
The files in the app are organized following the conventions demonstrated in lectures.	
The code in the app adheres to coding conventions demonstrated in lecture, like using plural names for arrays.	
The app does not contain dead code, commented-out sections, or console logs.	
The app is appropriately broken down into classes and functions with distinct roles.	
The app can be used without encountering errors and handles errors using the conventions demonstrated in lectures.	
The app is coded using proper indentation.	
The app's menu is easily navigable by a first-time user.	

Git and GitHub Requirements

Any items marked incomplete in this section will result in the project receiving a failing grade. Your interactions with Git and GitHub must fulfill the below requirements.

	Complete?
You are shown as the only contributor to the project on GitHub.	
The GitHub repository used for the project must be named appropriately. For example, names like dictionary-application or java-dictionary are appropriate, whereas ga-project is not. The repo must be publicly accessible. *Be sure to create the repo on your personal GitHub account and ensure it is public.*	
Commit messages should be descriptive of the work done in that commit.	

README Requirements

More than two items marked incomplete in this section will result in the project receiving a failing grade. If two or fewer items are marked incomplete, the project is considered passing. Your project's README must contain the items or sections below.

	Complete?
Your app's name.	
A brief description of your app and its functionality.	
A *Getting started* section. This section should include instructions on how to download and use your app.	
A *Technologies used* section. This section should list the principal technologies used by your application, for example, Java and any major frameworks or libraries.	
If necessary, your README should contain an *Attributions* section. This section should include links to any external resources (such as libraries or assets) you used to develop your application that require attribution. You can exclude this section if it does not apply to your application.	

Summary

Project meets minimum requirements and passes.
